Falling Weight Deflectometer and Pavement Testings

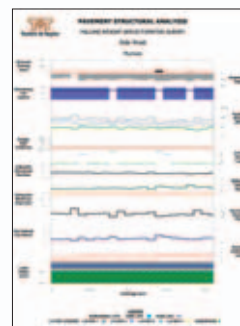

Falling Weight Deflectometer and Pavement Testing

Tonkin & Taylor operates 3 falling weight deflectometers for structural testing of pavements. A portable Geobeam Deflectometer has also been developed by T&T which provides deflection based profiling for analysis of pavement layer stiffnesses, residual life and assessment of rehabilitation options to achieve projected loading.

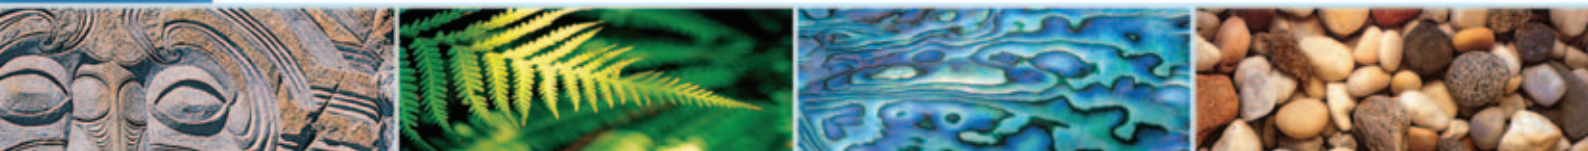

Deflection testing projects for structural assessment has been carried out in Malaysia, Australia, Pacific and NZ. T&T currently undertake the structural testing contract for condition evaluation of all NZ State Highways.

A comprehensive suite of downstream processing and analyses software options have been developed to enable roading engineers to assess remediation and upgrading works.
